PHYSIOLOGY

1. **Glomerular filtration rate would be increased by:**
   a) Increase in afferent arteriolar pressure
   b) Decrease in efferent arteriolar resistance
   c) increase in the concentration of plasma proteins
   d) compression of renal capsule
2. **In the ECG the p wave denotes:**
   a) atrial contraction
   b) atrial depolarization
   c) ventricular repolarize
   d) SA node depolarization
3. **ST segment elevate in II, III, IVF is representing:**
   a) posterior MI
   b) anterolateral MI
   c) inferior MI
4. **which substance increased effective renal surface area;**
   a) ADH
   b) histamine
   c) Endothelin
   d) dopamine
5. **Podocytes associated with which part of urinary tract systems:**
   a) DCT
   b) Bowman capsule
   c) Minor calyces
   d) Major calyces
6. **vomiting and diarrhea results in:**
   a) decrease ECF
   b) occurs after delivery

c) plasma loss

7. sickling of RBS triggered by

a) increased dehydration, increased p H and decrease oxygenation
b) decreased p H and decrease oxygenation
c) decreased dehydration, decreased p H and decrease oxygenation
d) increased dehydration, decreased p H and decrease oxygenation

8. Which of the following hormones act on the anterior lobe of the pituitary to inhibit secretion of prolactin:

a) dopamine
b) growth hormone
c) somatoststin

9. after a long period of corticosteroid therapy, the wound healing is delayed due to:

a) collagen damage
b) fibroblast elaboration
c) infection

10.Renal response due to hyperaldosteronism cause:

a) increase excretion of bicarbonate
b) increase Hydrogen secretion
c) increase K reabsorption
d) increase Hydrogen reabsorption

11.About renal circulation:

a) receive 10% of COP
b) in exercise COP increase and renal flow increase
c) Angiotensin II maintains GFR when renal blood flow increase

12.total peripheral resistance is controlled by

a) arteriolar tone
b) venule

c) external and internal iliac A

13.baroreceptors:

a) its stimulation leads to sympathetic activity
b) located in carotid sinus and aortic arch
c) stimulated by hypoxia

14.shock is:

a) decrease tissue perfusion
b) bacterial infection
c) microbial in blood

15.ammonia is a good buffer in urine because

a) renal produce small amounts of NH3 in chronic acidosis
b) renal wall impermeable to NH3
c) renal wall impermeable to NH4
d) reabsorbed in thick ascending loop.

16.in exercise man measuring ACTH and cortisol at evening and they found it in high level its occur in:

a) cushing
b) normally found this result in healthy exercisable man
c) Addison disease
d) conns disease

17.compensated respiratory acidosis marked by:

a) increased acidity of the urine
b) increased secretion of chloride
c) ammonia production by the kidney

18.failure to correct hypokalemia is concomitant caused by:

a. decrease sodium count
b. decrease magnesium count
c. decrease chloride count

19.hypokalemia diagnosed clinically mainly by:

a) cardiac arrhythmia
b) antagonized digoxin effect
c) diarrhea
d) hyperreflexias

20.the following statement concerning the defecation are true except:

a) the act is often preceded by the entrance of the feces into rectum.
b) the anterior abdominal muscles contract
c) the internal sphincter contracts and causes evacuation of feces
d) the external anal sphincter and puborectalis relaxes

21.When a person standing up and leans to one side the other side stretches and the same Side contracts, stretch reflex is described as:

a) Short fiber to obtain good contraction
b) Monosynaptic
c) Polysynaptic
d) Contain type 2 fiber
e) Occur in higher center

22.The principal androgen responsible for transforming undifferentiated fetal external genitalia into male external genitalia is

a) Müllerian-inhibiting substance
b) Androstenedione
c) Dihydrotestosterone
d) Testosterone
e) Androsterone

23.Myocardial contractility may be defined as the intrinsic ability of cardiac muscle fibers to Do work with a given preload and afterload Which of the following is the best measure of Left ventricular (LV) contractility?

a) Ejection fraction
b) LV end-diastolic pressure
c) LV end-diastolic volume
d) LV end-systolic pressure

e) Stroke volume

24.Pt has large hand and foot, gynecomastia and hirsutism. The causes Is due to tumor in:

a) Posterior pituitary gland
b) Anterior pituitary gland
c) Hypothalamus
d) Adrenal gland
e) Thyroid gland

25.Decrease in Chloride conduction through cell wall will cause:

a) Hyperpolarization if outside increase more than inside
b) hyperpolarization if outside lesser than inside
c) no change
d) it increases depolarization
e) None of the above

26.Which of the following is similarity between myoglobin and Hemoglobin:

a) Has the same affinity to oxygen
b) Has the same P50
c) Has the same saturation
d) Has the same sigmoid curve shape
e) Has the same 2,3 DPG content

27.Skeletal muscle fibers are broadly classified as "slow-twitch" (type 1) and "fast-twitch" (type 2). Which of the following true about muscle type II rapid twitch:

a) Have more myoglobin
b) More mitochondria
c) More endurance
d) Get fatigue faster

28.hypoxic cell injury occurs due to following except

a) reduce ATP

b) low PH
c) Decrease in hydrogen ion

29.depolarization occurs because

a) Na comes inwards
b) Na goes out word.

30.Which one of the following statements is correct?

a) About 100 mg of iron is absorbed per day
b) Iron is absorbed rapidly from the small intestine
c) Iron is transported in the blood bound to ferritin
d) Ferrous sulfate iron is 3 to 4 times has better Availability and better absorption than the iron from ferric sulfate.
e) Iron absorption is a passive process regulated by plasma iron levels

31.common cause of hyponatremia.

a) Cone syndrome
b) low sodium intake
c) high ADH

32.RMP _60 after opening of cl channels

a) depolarization -30
b) Depolarization +30
c) hyperpolarization-70

33.what of the following indicate the ovulation has taken place.

a) Progesterone
b) LH hormone
c) Estrogen
d) temperature

34.Renin converts casein to Para casein in presence of

a) Ca
b) Mg
c) Na
d) K

35. Which of the following test the most sensitive for diagnosis of iron deficiency anemia

a) serum iron
b) Serum transferrin
c) serum ferritin
d) serum erythropoietin

36. Which of the following represent the correct order of events of menstrual cycle?

a) FSH rise, LH surge, ovulation, Luteal phase, menstruation.
b) Luteal phase, menstruation, FSH rise, ovulation, follicular phase
c) follicular phase, Luteal phase, FSH rise, ovulation, menstruation
d) Menstruation, FSH rise, LH surge, ovulation, luteal phase

37. Which of the following represents the typical order of physical and physiologic changes of puberty in females?

a) Menarche, thelarche, andrenarche, peak growth velocity
b) Thelarche, andrenarche, peak growth velocity, Menarche
c) peak growth velocity, adrenarche, Menarche, thelarche
d) adrenarche, menarche, thelarche, peak growth velocity

38. What is the correct order to the phases of the sexual response cycle?

a) Sexual attraction or arousal, excitement phase, plateau phase, orgasm, resolution phase
b) Sexual attraction or arousal, excitement phase, orgasm, plateau phase, resolution phase
c) Sexual attraction or arousal, excitement phase, orgasm, resolution phase, plateau phase
d) plateau phase, excitement phase, orgasm, resolution phase, Sexual attraction or arousal

39. During the follicular phase, the dominant follicle arises in response to which of the following?

a) Matrix –degrading proteases

b) HCG
c) FSH
d) Androgens

40. Which of the following statement correctly describes one of the three physiologic differences between male and female orgasms?

a) The male is capable of rapidly successive orgasms
b) The female is capable of rapidly successive orgasms
c) The duration of the female orgasm is shorter than that of the male orgasm
d) The female experiences emission and ejaculation, but to lesser extent than the male

41. The posterior pituitary releases two hormones, arriving directly from the hypothalamus:

a) Insulin and thyroxine
b) Oxytocin and insulin
c) Oxytocin and ADH
d) ACTH

42. All of the following are true about human HCG hormone except:

a) In early pregnancy the level is expected to double every 2_3 days
b) it is structurally related to oxytocin, and bind to receptors to support the corpus luteum
c) It is initially produced by the trophoblast cells of the embryo
d) During the first trimester, it stimulates the fetal gonads to make steroid hormones responsible for sexual differentiation

43. There are at least four mechanisms involved in transporting critical molecules in matched with the appropriate mechanism?

a) Respiratory gases are transported by active transport
b) Immunoglobulin G (IgG) bind s a membrane receptor and enters via endocytosis
c) Calcium crosses the membrane by diffusion down a concentration gradient

d) Glucose is bind to membrane receptors and enters the placental tissue by endocytosis

44. S.D is a 25 years old woman who has been attempting to conceive for 1 year. She presented to an infertility doctor, as her efforts have been unsuccessful. she reported that she has been timing intercourse based on the change in her vaginal discharge, she noted that midcycle, her discharge becomes thin and watery, high level of which hormone account for this change along with softening of the cervical stroma?

a) Estrogen
b) Progesterone
c) Prolactin
d) Antidiuretic hormone

45. Vasopressin and oxytocin circulate unbound to proteins and have very short plasma half-lives on the order of:

a) 1-2 minutes
b) 2-4 minutes
c) 5-8 minutes
d) 10-12 minutes

46. In adrenal gland, the cholesterol is stored:

a) mostly in the free form
b) mostly in esterified form
c) large amount of free form and less amount of esterified form
d) equal amounts of free and esterified form

47. Biological activity of ACTH is completely lost on removal of:

a) 10 N-terminal amino acids
b) 24 N-terminal amino acids
c) 24 C-terminal amino acids
d) 15 C-terminal amino acids

48. Hyperglycaemic effect of glucocorticoids is due to:

a) inactivation of protein phosphatase
b) inactivation of fructose 1,6-bisphosphatase
c) stimulation of synthesis of pyruvate carboxylase
d) stimulation of synthesis of eltroxykinase

49.Cortisol is synthesized in:

a) zona fasiculata
b) zona glomerulosa
c) zona reticularis
d) chromaffin cells

50.Mineralocorticoids are steroid hormones produced from:

a) zona fasiculata
b) zona glomerulosa
c) zona reticularis
d) zona pellucida

51.Catecholamines are released from:

a) zona fasiculata
b) zona glomerulosa
c) zona reticularis
d) chromaffin cells

52.Hering-Breuer reflex related to:

a) effect of PH on respiratory center
b) effect of CO2 on respiratory center
c) effect of nerves on respiratory center
d) effect of temperature on respiratory center

53.The number of amino acids in the hormone oxytocin is:

a) 7
b) 9
c) 14
d) 18

54.very efficient inhibitor of steroid biosynthesis is:

a) Aminoglutethimide
b) Aminoimidazole
c) Aminoimidazolesuccinyl carboxamine
d) Aminopterin

55.In the synthesis of Angiotensin I, rennin acts on Angiotensinogen and cleaves the:

a) Leucine - leucine at 10 and 11 position
b) Valine - tyrosine at 3 and 4 position
c) Isoleucine - histidine at 5 and 6 position
d) Proline - histidine at 7 and 8 position

56.The defect in adrenal cortex responsible for lack of glucocorticoids and mineralcorticoids is:

a) Androstenedione deficiency
b) 17 α -OH progesterone deficiency
c) C-21 hydroxylase deficiency
d) Testosterone deficiency

57.Which of the normal range of ionized calcium in plasma is:

a) 2-4 mg/dl
b) 2-4 mEq/L
c) 4-5 mg/dl
d) 4-5 mEq/L

58.Pregnant lady presented with temporary blindness, what is cause?

a. effect of progesterone making oedema in optic chiasma

59.increase volume in pregnancy due to:

a) increase thirst threshold
b) stimulation of ADH
c) inhibition of ANP
d) increase aldosterone production

60.compete with iodine uptake:

a) fluroacetate
b) thiocyanate
c) fluoride d.

61.When total lung capacity = 5L, tidal volume = 2.5L, IVR= 1, ERV= 1, what is residual volume?

a) 1.5 L
b) 2 L
c) 2.5 L
d) 0.5 L

62.Which of the following used to confirm invariable ovulation:

a) mid-luteal progesterone
b) LH surge
c) FSH
d) Estrogen

63.Pituitary stalk block cause increase in:

a) PRL
b) ACTH
c) FSH
d) LH

64.Mature corpus luteum has low expression of:

a) Aromatase
b) 17-hydroxlase
c) 17 beta HSD

65.Regarding ovulation:

a) occurs 14 days after LMP
b) estrogen increase before LH surge c.

66.Thyroperoxidase enzymes contains:

a) Heme
b) Copper
c) Zinc
d) Magnesium

67.Which of the following statement regarding TFT in pregnancy is true:

a) normal total, normal T4
b) normal total, increase T4
c) increase total, increase T4

d) increase total, normal T4

68. Which of the following is the most important factor to determine the placental blood flow:

69. Thyroperoxidase used H2O2 as oxidative agent, H2O2 come from:

a) FAD dependent enzyme
b) NAD dependent enzyme
c) NADPH dependent enzyme d.

70. Effect of cortisol in pregnancy:

a) increase the liver protein binding protein
b) decrease gluconeogeneseis
c) increase glycogenolysis
d) decrease lipid accumulation in liver

71. Progesterone:

a) convert estradiol to estrone
b) responsible for glandular proliferation
c) causes uterine contraction
d) decrease thickness of the cervical mucosa

72. Central chemoreceptor stimulated by:

a) CO2
b) O2
c) PH
d) H

73. Baby boy presented with ambiguous genitalia this may be caused by deficiency of which enzyme:

a) 11- hydroxylase
b) 17- alpha hydroxylase
c) 17- beta hydroxylase
d) 21- hydroxylase

74. Which structure produces gonadotropins?

a) Hypothalamus
b) Anterior pituitary
c) Posterior pituitary
d) Ovaries

75.Homeostasis:

a) must always be restored using negative feedback mechanisms
b) provides for the tight regulation of all physiological variables
c) is the sum of all chemical reactions in the body
d) is a combination of positive and negative feedback

76.The cardiovascular system:

a) contains approximately 7 L of blood in a 70 kg man
b) is arranged mostly in series with each tissue receiving blood from the aorta
c) is arranged mostly in parallel with each tissue receiving blood from the aorta
d) maintains a constant pressure throughout the system

77.Which of the following statements concerning coronary circulation is true?

a) Left ventricular perfusion only occurs during diastole
b) The heart receives a rich blood supply from the left and right coronary arteries arising from the coronary sinus
c) The coronary veins run parallel to the right coronary arteries and empty into the aortic sinus
d) During systole, contraction of the ventricles compresses the coronary arteries and suppress blood flow

78. Which of the following indicates the causes of the first and second heart sound in the correct order?

a) atrial systole - ventricular systole
b) semilunar valve closure - atrioventricular valve closure
c) C-ventricular diastole - semilunar valve closure
d) ventricular systole - ventricular diastole

79. Osmosis is:

a) the active movement of water across a permeable membrane from a region of high concentration to that of a lower solute concentration
b) the passive movement of water across a semi-permeable membrane from a high solute concentration to that of a lower solute concentration

c) the active movement of water across a permeable membrane from a region of low concentration to that of a higher solute concentration
d) the passive movement of water across a semi-permeable membrane from a low solute concentration to that of a higher solute concentration

80. The colloidal osmotic or oncotic pressure is

a) important for controlling cell volume
b) a key determinant for fluid movement across capillary walls
c) largely determined by the Na concentration in plasma
d) higher in interstitial fluid than in plasma

81. The ventricular end-diastolic volume in man and the end-diastolic pressure is approximately:

a) 130 mL, >100 mmHg
b) 130 mL, <10 mmHg
c) 70 mL, <10 mmHg
d) 70 mL, >100 mmHg

82. Cardiac output is:

a) the volume of blood pumped per minute by both ventricles
b) the volume of blood flowing through the systemic circulation per minute
c) not affected by the filling pressure (preload)
d) approximately 5 L/min at rest rising to over 100 L/min during exercise

83. An orgasm:

a) is due to a reflex activation of the parasympathetic nerves in both males and females
b) in males involves the mixing of the sperm and the secretions of the bulbourethral gland, seminal vesicle and prostate gland before they enter the urethra
c) in males involves the secretion of the sugar glucose to provide energy
d) in females may involve the release of pituitary oxytocin elicited by mechanical stimulation of cervix

84. The main hormone involved in the milk let-down reflex is

a) progesterone

b) ostrogens
c) oxytocin
d) prolactin

85. Noradrenaline

a) has a positive inotropic effect on the heart muscle cells whilst acetylcholine has a negative inotropic effect
b) is released by the sympathetic fibers innervating the SA node only
c) has a positive chronotropic effect on cardiac cells by increasing the rate of decay of the pacemaker potential
d) slows down the Ca sequestration into the sarcoplasmic reticulum thereby increasing

86. Excitation-contraction coupling in cardiac ventricular cells requires

a) efflux of Na ions
b) efflux of K lons
c) influx of Ca ions
d) influx of CI ions

87. Action potentials in ventricular muscles

a) are identical to those in skeletal muscles except for the duration of the action potential
b) have a plateau phase caused by the delay in the opening of K channels
c) are initiated when ventricular myocytes are depolarized to a threshold potential of -50 mV
d) have a refractory period which prevents another action potential being initiated until the muscle relaxes

88. Human chorionic gonadotrophin (hCG)

a) begins to be produced about 4 weeks after fertilization
b) is produced by the corpus luteum after ovulation
c) maintains the corpus luteum for a short period
d) signals that a new menstrual cycle should begin

89. Release of the hormone relaxin

a) inhibits the development of additional ova
b) inhibits uterine contraction
c) stimulates the development of the endometrium
d) softens the cervix prior to parturition

90. Regarding the control of lactation:

a) prolactin stimulates milk ejection
b) placental steroid secretion inhibits lactation during pregnancy
c) vasopressin (ADH) is secreted in response to suckling
d) oxytocin secretion can be suppressed by dopamine agonists

91. Colostrum:

a) contains high levels of antibodies that provide the infant with basic immunological protection for the rest of its life
b) is particularly rich in proteins
c) has a higher sugar content than milk
d) has a higher fat content than milk

92. The mean arterial blood pressure is

a) 110 mmHg in a healthy person
b) calculated by averaging the systolic blood pressure and the diastolic blood pressure
c) estimated as the diastolic blood pressure plus one third of the systolic blood pressure
d) estimated as the diastolic blood pressure plus one third of the pulse pressure

93. If a hypotonic fluid is ingested

a) intracellular fluid is diluted and cells swell
b) intracellular fluid is diluted but cells stay the same size
c) intracellular fluid is unaffected
d) intracellular fluid is concentrated and cells shrink

94.How do circulating TSH levels change during pregnancy?

a) Increased
b) Decreased
c) Remain unchanged
d) Increase then decrease

95. Prolactin:

a) inhibits release of follicle-stimulating hormone from the pituitary
b) levels in the plasma rise following birth and lead to milk production
c) is only released in and around birth
d) release is maintained after birth mainly by suckling

96. The unfertilized ovum can survive for __ after ovulation

a) 1–2 h
b) 10–12 h
c) 24 h
d) 2–3 days

97. The percentages of water in each of the fluid compartments are approximately __ intracellular fluid, __ interstitial fluid and __ plasma

a) 22%, 13%, 65%
b) 70%, 20%, 10%
c) 65%, 22%, 13%
d) 20%, 10%, 70%

98. Erythrocyte production

a) occurs in the liver and spleen in neonates
b) is impaired at high altitude
c) is stimulated by hyperoxia
d) is stimulated by erythropoietin released from the liver and spleen

99. White blood cells:

a) do not contain a nucleus
b) have a lifespan of 100–130 days
c) include lymphocytes which destroy bacteria by a process called phagocytosis
d) can release mediators such as histamine that are involved in inflammatory processes

100. Platelets:

a) release ADP after activation
b) are also called megakaryocytes
c) can only be activated via their glycoprotein receptors
d) have dense vesicles containing histamine

101. During primary homeostasis

a) fibrinogen is converted to fibrin
b) the initial vasoconstriction does not require platelet activation
c) thromboxane A2 causes platelet adhesion
d) activation of lipoxygenase is a vital step

102. Regarding smooth muscle:

a) it has actin and myosin filaments organized into myofibrils

b) it is multinucleated
c) like cardiac muscle, the cells are joined together by gap junctions called intercalated discs
d) it is capable of prolonged contraction without fatigue and with little energy consumption

103. The effect of nerve stimulation on smooth muscle is

a) excitatory only
b) inhibitory only
c) both excitatory or inhibitory
d) modulatory only

104. In the heart, the cardiac output is approximately __/min at rest, rising to above __/min during exercise. The stroke volume at rest is approximately

a) 20 L, 100 L, 1 L
b) 5 L, 100 L, 70 mL
c) 500 mL, 20 L, 7 mL
d) 5 L, 20 L, 70 mL

105. Conduction of impulses between the atria and the ventricles is channeled through the

a) AV node
b) annulus fibrosus
c) SA node
d) bundle of His

106. During which phases of the cardiac cycle do the atrioventricular valves remain open?

a) atrial diastole
b) isovolumetric ventricular relaxation
c) isovolumetric ventricular contraction
d) passive filling

107. Which hormone is responsible for fat distribution around the breast

a) Progesterone
b) Estrogen
c) Growth hormone
d) Prolactin

108. Percentage of plasma in total body weight:

a) 2%
b) 5%
c) 7%
d) 10%

109. With regard to puberty:

a) Puberty begins with the increased release of luteinizing hormone
b) The onset of menstruation in females occurs at roughly 47 kg irrespective of age
c) In males, luteinizing hormone stimulates the release of testosterone from the Sertoli cells
d) Secondary sexual characteristics are stimulated by testosterone

110. During fertilization:

a) acid in the uterus triggers capacitation of sperm
b) the glycoprotein ZP2 acts as a sperm receptor on the zona pellucida
c) the ovum undergoes electrical depolarization and discharges granules that impair further binding of sperm
d) after about 10 h the male and female pronuclei fuse

111. A person with 60 kg wt. and haematocrit 40% what is total blood volume:

a) 6L
b) 5L
c) 4L
d) 3L

112. Which of the following is correct:

a) angiotensin 2 increase H Secretion in proximal
b) parathyroid increase ph. reabsorption
c) ADH increase water reabsorption in proximal convoluted tubule
d) Aldosterone increases reabsorption of K at distal convoluted tubule

113. Regarding Lymph flow:

a) proportionate to ECF volume
b) Decrease with increase hydrostatic pressure
c) increase with increase protein in Interstitium
d) Increase with decrease protein in plasma

114. Na/k ATPase is inhibited by:

a) Dopamine
b) G actin
c) Thyroid hormone

115. hypo ventilated patient co2 doubled to 80. Patient breathing at room air, which of the following is true:

a) Arterial pressure of PO2 is 70hg
b) Arterial pressure of PO2 is 35 hg
c) C-HB saturation to o2 is 80%
d) D-HB saturation o2 is 50%

116. Vit D:

a) 1,25 hydroxy cholecalciferol receptors may be found in skin
b) if calcium level is high, 24,25 cholecalciferol also will be elevated
c) 25 cholecalciferol hydroxylation occurs in proximal convoluted tubules
d) 1,25 cholecalciferol hydroxylation stimulated by angiotensin II

117. Skeletal muscle depolarization:

a) long refractory period than nerve
b) spread in variable strength in muscle fibre

118. Autonomic nervous system and Cholinergic receptor:

a) Increase gastric secretion and gastric vasculature

119. Which of the following is true about acid base balance:

a) Decreased renal secretion of cl in metabolic acidosis
b) Chemoreceptor limit the respiratory compensation in metabolic acidosis
c) Decrease production of glutamine by liver
d) Hco3 decreased in compensated respiratory acidosis

120. 22-year-old man Stand suddenly from supine position, which of the following is a compensatory mechanism:

a) Increase contractility
b) Increase TPR
c) decrease cardiac output
d) Decrease heart rate

121. coagulation:

a) prothrombin activate fibrinogen to fibrin

122. Why capillaries have low blood flow rate:

a) high cross section
b) high osmolality
c) high viscosity
d) High diameter

123. Membrane potential:

a) Inside is more negative than outside
b) maintain many by Na+/k+ pump
c) Na/K pump has no role

124. Steroid hormones:

a) have receptors in cytoplasmic and nucleus
b) Increase cAMP
c) Increase tyrosine kinase activity

125. The most potent Vitamin D metabolite is:

a) 25-Hydroxycholecalciferol
b) 1,25-Dihydroxycholecalciferol
c) 24, 25-Dihydroxycholecalciferol
d) 7-Dehydrocholesterol

126. Levels of hCG in the maternal circulation typically peak at what level and at what gestational age?

a) 100,000 ml U/mL at 10 weeks
b) 10,000 ml U/mL at 10 weeks
c) 10,000 ml U/mL at 20 weeks
d) 100,000 ml U/mL at 40 weeks
e) 10,000 ml U/mL at 40 weeks

﴿وَمَا تَوْفِيقِي إِلَّا بِاللَّهِ ۚ عَلَيْهِ تَوَكَّلْتُ وَإِلَيْهِ أُنِيبُ﴾
